## Maher on the Law of Likelihood

Patrick Maher

Scientific Thought II  
Spring 2010

## Notation

$E$  = evidence

$H_i$  = incompatible hypotheses

$p(H)$  = ip of  $H$  given only background evidence

$p(H|E)$  = ip of  $H$  given  $E$  in addition to background evidence

## Definition

$E$  **favours**  $H_1$  over  $H_2$  if

$$\frac{p(H_1|E)}{p(H_2|E)} > \frac{p(H_1)}{p(H_2)}.$$

In words: Evidence  $E$  increases the ratio of the probability of  $H_1$  to the probability of  $H_2$  (where probability = ip).

## Examples

①  $p(H_1|E) = 0.2, p(H_2|E) = 0.1, p(H_1) = p(H_2) = 0.4.$

$$\frac{p(H_1|E)}{p(H_2|E)} = 2. \quad \frac{p(H_1)}{p(H_2)} = 1.$$

$E$  favors  $H_1$  over  $H_2$ .

②  $p(H_1|E) = 0.6, p(H_2|E) = 0.3, p(H_1) = 0.4, p(H_2) = 0.2.$

$$\frac{p(H_1|E)}{p(H_2|E)} = 2. \quad \frac{p(H_1)}{p(H_2)} = 2.$$

$E$  doesn't favor  $H_1$  over  $H_2$  or  $H_2$  over  $H_1$ .

## Note

" $E$  favors  $H_1$  over  $H_2$ " doesn't imply  $p(H_1|E) > 1/2$  or  $p(H_1|E) > p(H_1)$ .

# The law of likelihood

## The law

$E$  favors  $H_1$  over  $H_2$  if and only if  $p(E|H_1) > p(E|H_2)$ .

- Probabilities of the form  $p(E|H_i)$  are called *likelihoods*.
- The law follows from the laws of probability and the definition of favoring (proof at the end).

## Examples

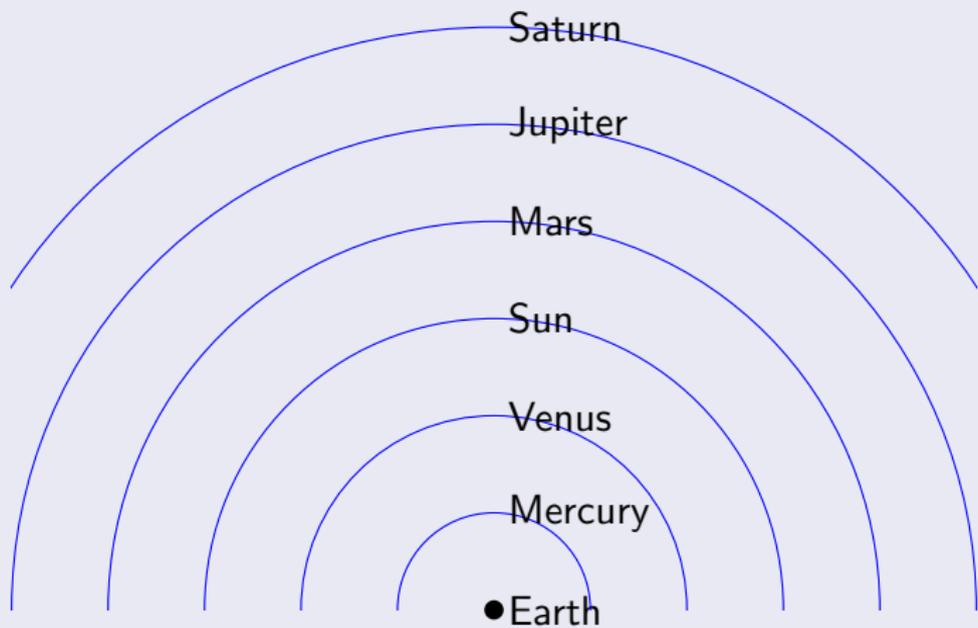

- 1 If  $H_1$  implies  $E$  and  $H_2$  doesn't then  $p(E|H_1) = 1$  and  $p(E|H_2) < 1$ , so  $E$  favors  $H_1$  over  $H_2$ .
- 2 If  $H_1$  and  $H_2$  both imply  $E$  then  $p(E|H_1) = 1$  and  $p(E|H_2) = 1$ , so  $E$  doesn't favor either hypothesis over the other.

- 1 State the definition of favoring and the law of likelihood.
- 2 For each of the following, say which (if either) of  $H_1$  and  $H_2$  is favored by  $E$ . Justify your answers using either the definition of favoring or the law of likelihood.
  - (a)  $p(H_1|E) = 0.7$ ,  $p(H_2|E) = 0.2$ ,  $p(H_1) = 0.5$ ,  $p(H_2) = 0.1$ .
  - (b)  $p(E|H_1) = 0.7$ ,  $p(E|H_2) = 0.2$ ,  $p(H_1) = 0.5$ ,  $p(H_2) = 0.1$ .
  - (c) A ball is drawn from an urn.  $H_1 = 10\%$  of the balls in the urn are black,  $H_2 = 20\%$  of them are black,  $E =$  the ball drawn is black.
  - (d) A die is tossed.  $H_1 =$  it came up 4 or 6,  $H_2 =$  it came up 2,  $E =$  it came up even.

# Application to Ptolemy and Copernicus

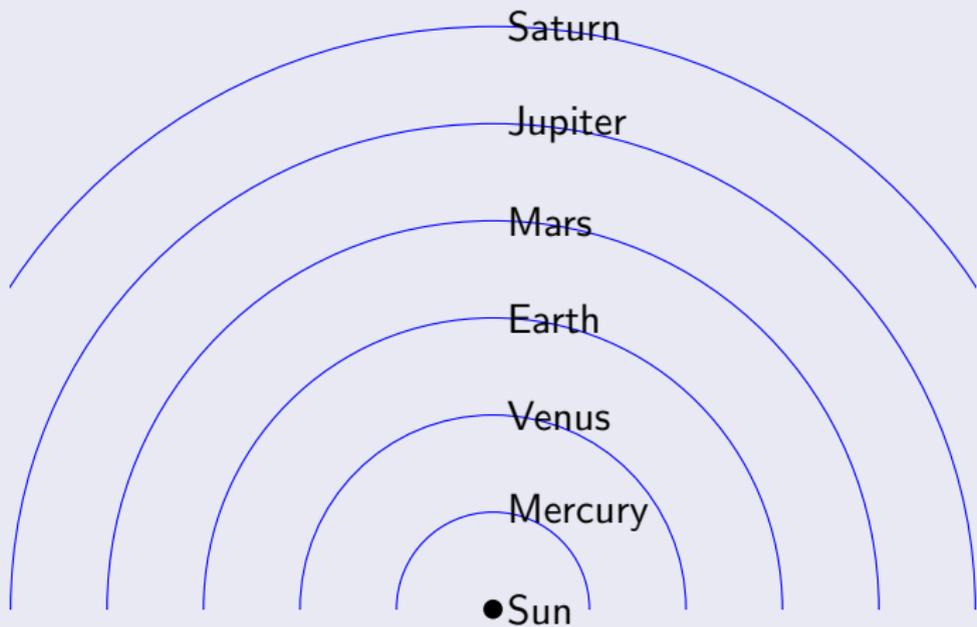

## $T$ (Ptolemy's claim)

The sun and planets orbit the earth, in the order shown.  
Planets are on epicycles.

## C (Copernicus's claim)

The planets, including the earth, orbit the sun in the order shown.  
No epicycles.

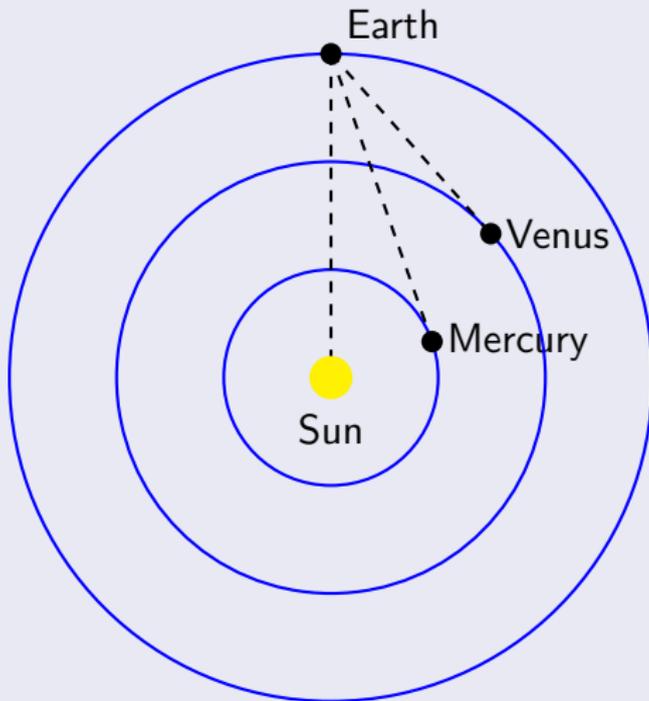

$E_1$ : Mercury and Venus always appear close to the Sun

- Mercury is never more than  $28^\circ$  from the Sun; Venus is never more than  $48^\circ$ .
- Other planets can be on the opposite side of the sky to the Sun; Mercury and Venus never are.

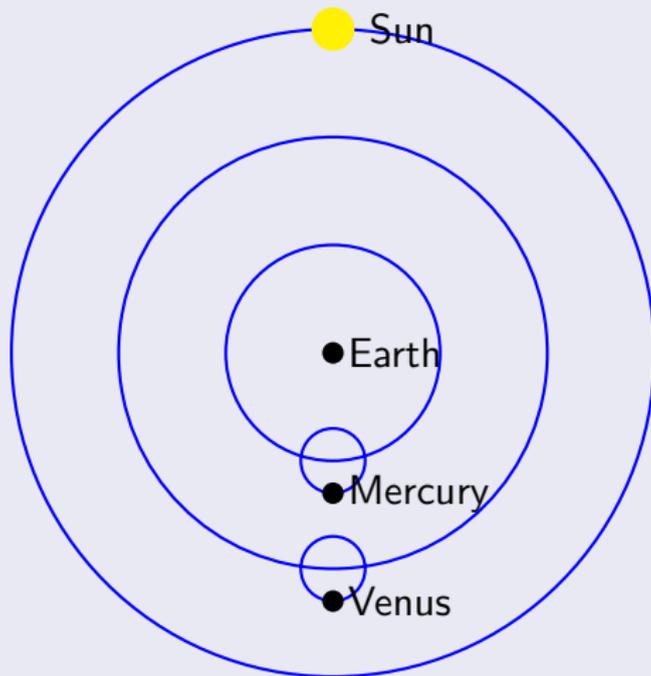

## $C$ implies $E_1$

Since Mercury and Venus orbit the sun with a smaller orbit than the earth's, they can never appear far from the sun.

$T$  doesn't imply  $E_1$

This is consistent with  $T$ :

## Application of law of likelihood

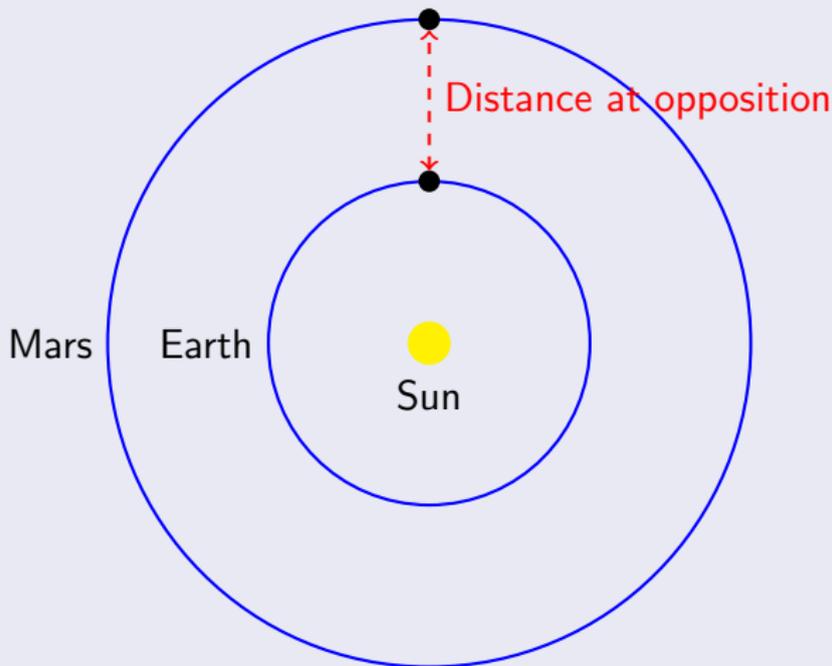

- $p(E_1|C) = 1$ , since  $C$  implies  $E_1$ .
- $p(E_1|T) < 1$ , since  $T$  doesn't imply  $E_1$ .
- So  $p(E_1|C) > p(E_1|T)$ .
- So, by the law of likelihood,  $E_1$  favors  $C$  over  $T$ .

$E_2$ : Superior planets are closest when in opposition to the sun

- The superior planets are Mars, Jupiter, and Saturn.
- A planet is in opposition to the sun when it is on the opposite side of the sky to the sun.
- We know the superior planets are closest when in opposition because that is when they are brightest.

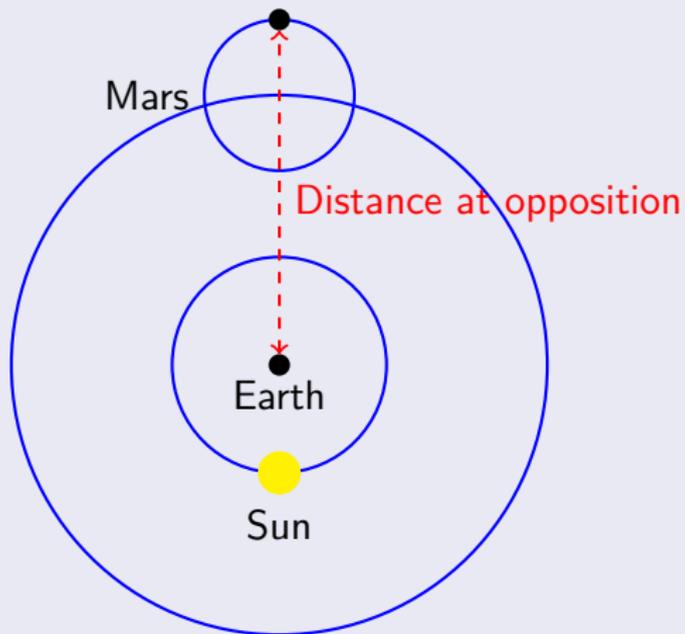

## $C$ implies $E_2$

When a superior planet is in opposition to the sun, the earth is between the planet and the sun, which minimizes the distance to the planet.

$T$  doesn't imply  $E_2$

This is consistent with  $T$ :

## Application of law of likelihood

- $p(E_2|C) = 1$ , since  $C$  implies  $E_2$ .
- $p(E_2|T) < 1$ , since  $T$  doesn't imply  $E_2$ .
- So  $p(E_2|C) > p(E_2|T)$ .
- So, by the law of likelihood,  $E_2$  favors  $C$  over  $T$ .

- ③ Let  $T$  = Ptolemy's claim that the sun and planets orbit the earth on epicycles,  $C$  = Copernicus's claim that the earth and other planets orbit the sun. Which of these is favored by the following pieces of evidence? Justify your answer using the law of likelihood; draw diagrams as appropriate.
- $E_1$ : Mercury and Venus always appear close to the sun.
  - $E_2$ : The superior planets are closest to the earth when in opposition to the sun.

# Proof of the law of likelihood (not on the exam)

Let  $H_1, \dots, H_n$  be an exhaustive set of incompatible hypotheses. By a law of probability called Bayes's theorem:

$$p(H_i|E) = \frac{p(E|H_i)p(H_i)}{p(E|H_1)p(H_1) + \dots + p(E|H_n)p(H_n)}.$$

Dividing the expression for  $i = 1$  by the one for  $i = 2$  gives:

$$\frac{p(H_1|E)}{p(H_2|E)} = \frac{p(E|H_1) p(H_1)}{p(E|H_2) p(H_2)}.$$

It follows that

$$\frac{p(H_1|E)}{p(H_2|E)} > \frac{p(H_1)}{p(H_2)} \text{ if and only if } \frac{p(E|H_1)}{p(E|H_2)} > 1.$$

So, by the definition of favoring,  $E$  favors  $H_1$  over  $H_2$  if and only if  $p(E|H_1) > p(E|H_2)$ .
